PCM Line Interface Chip

GENERAL DESCRIPTION

The XR-T5683 is a PCM line interface chip. It consists of both transmit and receive circuitry in a DIL 18 pin package. The maximum bit rate the chip can handle is 8,448 M Bits/s and the signal level to the receiver can be attenuated by -10dB cable loss at half the bit rate. At nominal supply voltage operation the typical current consumption is 40mA.

FEATURES

Single +5.0V Supply

Receiver Input Can Be Either Balanced or Unbalanced
Up to 8,448 M Bits/s Operation in Both Tx and Rx Directions
TTL Compatible Interface

APPLICATIONS

SYSTEM DESCRIPTION

The incoming bipolar PCM signal which is attenuated and distorted by the cable is applied to the threshold comparator and the peak detector. The peak detector generates a DC reference for the threshold comparator for data and clock extraction. A tank circuit tuned to the appropriate frequency is added to the later operation. The clock signal, data (+) data (-) all go through a similar level shifter to be converted into TTL level to be compatible for digital processing.

In the transmit direction, the output drivers consist of two identical TTL inputs with open collector output stages. The maximum low level current these output stages can sink is 40 mA. With full width data applied to the inputs together with a synchronized clock. The output will generate a bipolar signal when driving a centre-tapped transformer. A typical circuit diagram to XR-T5683 is shown in Figure 1.
